Shopper-Intend-MLOps

NA (Offsite)

Feb 2026 to Present (Full Time)

What it does: This is an end-to-end ML project that predicts whether an online shopper will make a purchase, using browsing behavior data (pages visited, time spent, bounce rate, exit rate, etc.). Data Pipeline: Raw data is stored in MySQL, then an ETL pipeline (extract, validate, transform, load) moves clean data into a PostgreSQL data warehouse. ML Pipeline: After preprocessing (scaling, feature selection, and fixing class imbalance with SMOTE), three models — Random Forest, XGBoost, and LightGBM — are trained with GridSearchCV hyperparameter tuning, and the best model (based on ROC AUC) is tracked and registered using MLflow. API & Frontend: FastAPI powers the prediction API (3 endpoints: /, /health, /predict) with a Jinja2-based HTML frontend, and 5 Pytest test cases validate the API. Automation: APScheduler runs the entire pipeline (ETL ? retrain ? drift report) automatically every night at 2 AM, while Evidently AI monitors data drift. Deployment: The app is containerized with Doc

Demand Forecasting & Inventory Optimization Engine

Self-Initiated / Academic POC (Nagpur: Offsite)

May 2019 to Jun 2019 (Full Time)

- Built a Demand Forecasting system for Supply Chain inventory optimization using historical sales data. - Applied XGBoost and Facebook Prophet models to predict product demand with seasonality and trend analysis. - Integrated feature engineering with lag variables, rolling averages, and holiday effects. - Achieved MAPE of 8.3% on test data for accurate demand prediction. - Created an interactive Streamlit dashboard showing forecasted vs actual demand with inventory recommendation alerts. - Key Outcome: Simulated 25% reduction in overstock cost and 40% decrease in stockout events. - Tech Stack: Python, XGBoost, Prophet, Pandas, Scikit-learn, Streamlit, Seaborn.

Predictive Maintenance System for Industrial Equipment

Self-Initiated / Academic POC (Offsite)

Jan 2019 to Mar 2019 (Full Time)

Developed a Predictive Maintenance POC for industrial equipment using sensor data (vibration, temperature, pressure). Applied time-series analysis and LSTM-based deep learning model to predict machine failures 24—48 hours in advance. Used NASA CMAPSS dataset for training and validation. Achieved 89% prediction accuracy with early fault detection. Built an alert dashboard using Streamlit to visualize real-time equipment health scores. Key outcome: Simulated 30% reduction in unplanned downtime. Tech Stack: Python, LSTM, Scikit-learn, Pandas, Streamlit, Matplotlib.

Profile summary

Motivated and detail-oriented Data Scientist / Data Analyst fresher with strong academic foundation in Machine Learning, Deep Learning, and Data Analytics. Hands-on project experience in Python, R, SQL, and end-to-end ML model building, data preprocessing, EDA, and model deployment. Proficient in Regression, Classification, Clustering, and Ensemble Learning techniques, with exposure to Neural Networks, CNN, RNN, and LSTM using TensorFlow and PyTorch. Skilled in Natural Language Processing (NLP) — including Sentiment Analysis, Text Classification, and Named Entity Recognition (NER). Experienced in Data Visualization using Power BI, Tableau, Matplotlib, and Seaborn, and familiar with Big Data and Cloud technologies. Passionate about applying AI/ML solutions to solve real-world business intelligence, credit risk, fraud detection, and customer analytics problems. Eager to contribute analytical skills and a strong learning mindset to a dynamic organization as an entry-level Data Scientist.
